

# Kotti The Multimodal Companion

Kotti perceives not just commands, but contexts. Through the fusion of computer vision, auditory sensing, and haptic feedback, it recognizes micro-expressions, anticipates emotional states, and cultivates a learning relationship unique to each user.

## Built-in Mainstream AI Model

## Supports Multiple Languages

## Personality Customization

## Proactive Proximity Sensing

# Let sound be seen.

As we optimize voice interaction, gaze tracking, and AI description capabilities to make glasses more accessible for people with hearing impairments, these technologies will ultimately benefit ordinary users as well.

## Binocular Display

Self-developed Near-eye Display System Venus OS

*Equipped with core AR optical waveguide technology*

*Integrated with multimodal AI recognition*

*Converts speech to text in real time and projects it clearly onto the lenses*

*Enables zero-latency visual communication*

## Prompter Artifact, Make Presentations More Composed

- 150 nits brightness, both virtual and reality are clear
- Be more composed: Be clearer, be more confident

*Medical-grade design suitable for daily and clinical scenarios*

*Ultra-light body for comfortable wearing*

*High-definition display resistant to strong light*

*Precisely solves the communication challenges of the hearing-impaired*

*Reshaping a new experience of efficient and natural communication*
